

# SUCCESSFUL APPLICATIONS FIELD TRIALS

## Wheat

Kelgrows was applied on wheat once at the 4-6 leaves phase with different dilution rates:

Control (equivalent volume of water)

Kelgrows diluted 1:100 (4 Lt/ha)

Kelgrows diluted 1:200 (2 Lt/ha)

Kelgrows diluted 1:400 (1 Lt/ha)

Results show that Kelgrows performs better at higher dilution rates, achieving a crop yield increase of +19% with a dilution rate of 1:400.

On Wheat we suggest to apply our product at an early stage (4-6 leaves) and using an application rate from 1 pt./acre to a maximum of 1 qt./acre.
